

Abstract

[0157] This invention discloses an integrated information service platform system and method thereof having an access unit for connecting with a user terminal and service provider processing system through a transmission network, for allowing a plurality of user terminals to be accessible, for accepting the service request from users and for converting the request into platform uniform data. The integrated service platform further includes a management unit for managing with an identified interface, for receiving the unified format data coming from the access unit and for making the verification and authorization of users. The integrated service platform further includes an application unit, a component of which executes predetermined application processing functions, the application unit selecting a middleware corresponding to a service request for processing, and returning a processed result to the access unit for conversion, and then to the user. The system is based on the Internet or an Intranet, and realizes uniform access, management and application, thereby making information service no longer limited by time, region and access mechanism.
